🌐 Module 03: Open Source Intelligence (OSINT) and Attack Surface Mapping

```
# Exercise 3: Collecting OSINT on Target's Employees
```

Scenario

This lab focuses on gathering OSINT about the target organization's employees from publicly accessible sources. It helps penetration testers identify employee roles, email addresses, social media profiles, job titles, professional networks, personal information, and contact details, which can be leveraged for social engineering attacks and further reconnaissance.

Objective

The objective of this lab is to help students learn different techniques to gather employee information:
- Collect OSINT on Target's Employees from Social Media Accounts using Sherlock
- Perform Social Media Content Analysis and OSINT Investigations using Maigret
- Search for People information using **https://cylect.io/**

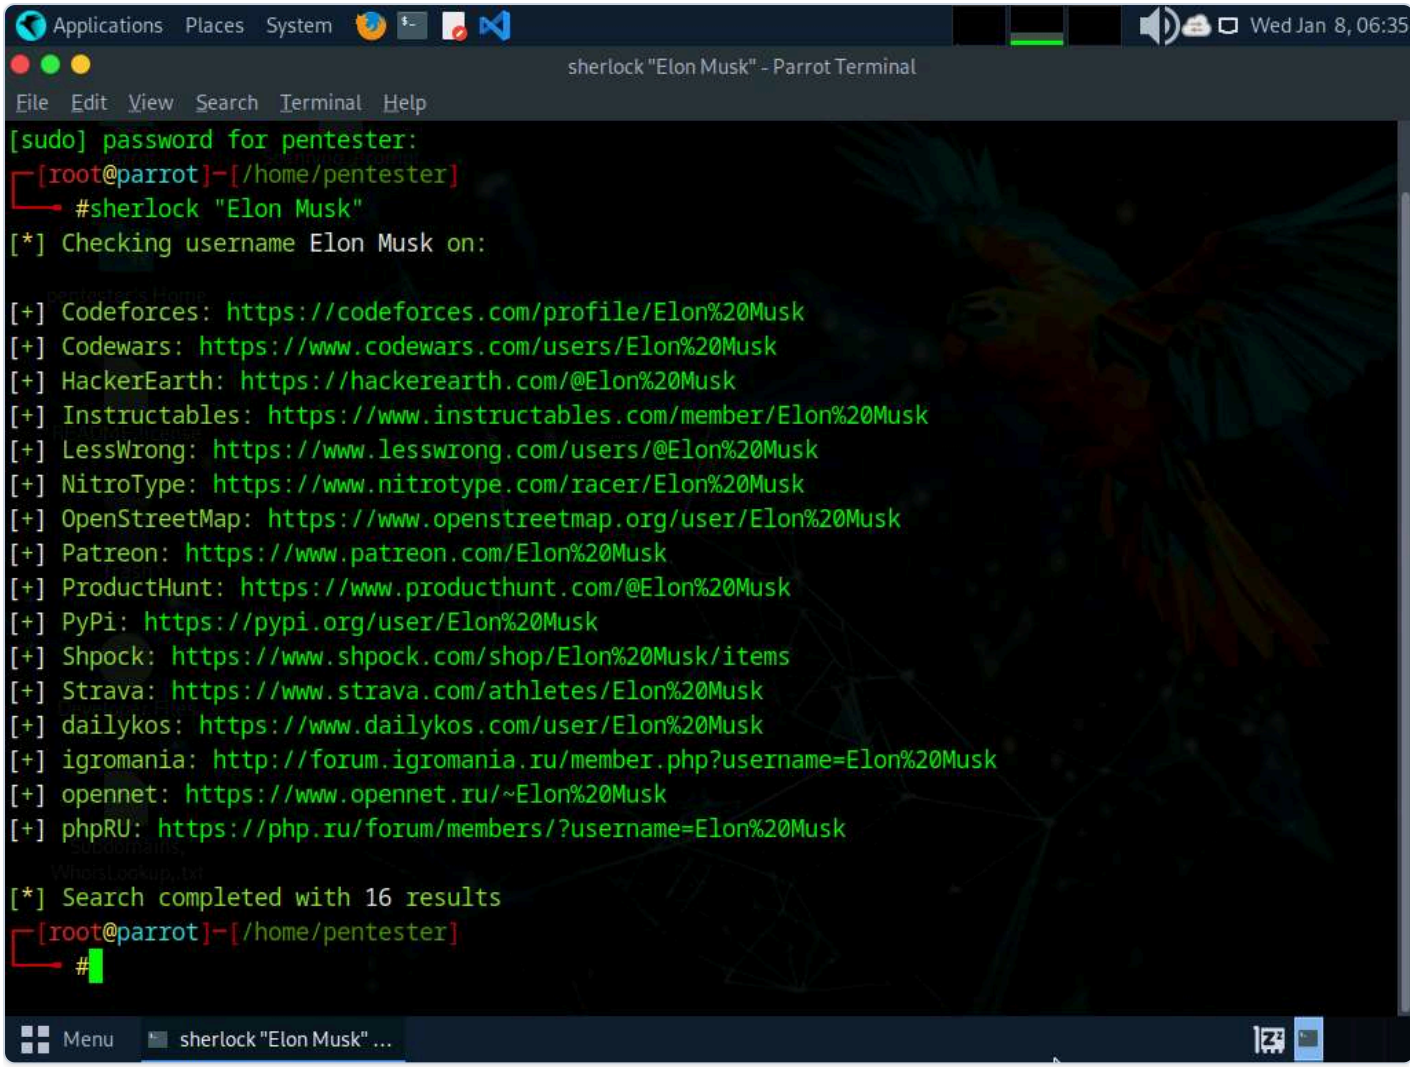

Task 1: Collecting OSINT on Target's Employees from Social Media Accounts using Sherlock

Sherlock is a Python-based tool that is used to gather information about a target person over various social networking sites. Sherlock searches a vast number of social networking sites for a given target user, locates the person, and displays the results along with the complete URL related to the target person.

Here, we will use Sherlock to gather personal information about the target from the social networking sites. Here, we are gathering information about Elon Musk. However, you can select a target of your choice.

Lab Tasks

1. Click **Parrot Security** to switch to Parrot Security machine, open a Terminal window, and execute **sudo su** to run the programs as a root user (When prompted, enter the password **toor**).
2. *(The password that you type will not be visible.)*
3. Run **sherlock "Elon Musk"** command and you will get all the URLs related to Elon Musk, as shown in the screenshot. Scroll down to view all the results.
4. *(The results might differ when you perform this task. If you receive any error messages in between ignore them.)*

You can use the gathered URLs to obtain sensitive information about the target such as DOB, employment status, and information about the organization that they are working for, including the business strategy, potential clients, and upcoming project plans.

This concludes the demonstration of collecting OSINT on target employees from Social Media accounts using Sherlock.

You can also use tools such as **Social Searcher** (**https://www.social-searcher.com**), **UserRecon** (**https://github.com**), etc. to collect additional information related to the target company and its employees from social networking sites.

Close all open windows and document all the collected information.

> **IMPORTANT:** ❓ **Question 3.3.1.1** On Parrot Security machine, utilize Sherlock to collect publicly available personal information about Elon Musk. Write the command used to gather information of Satyam Nadella. [!SUCCESS] ✅ **Answer:** **sherlock "Satyam Nadella"**

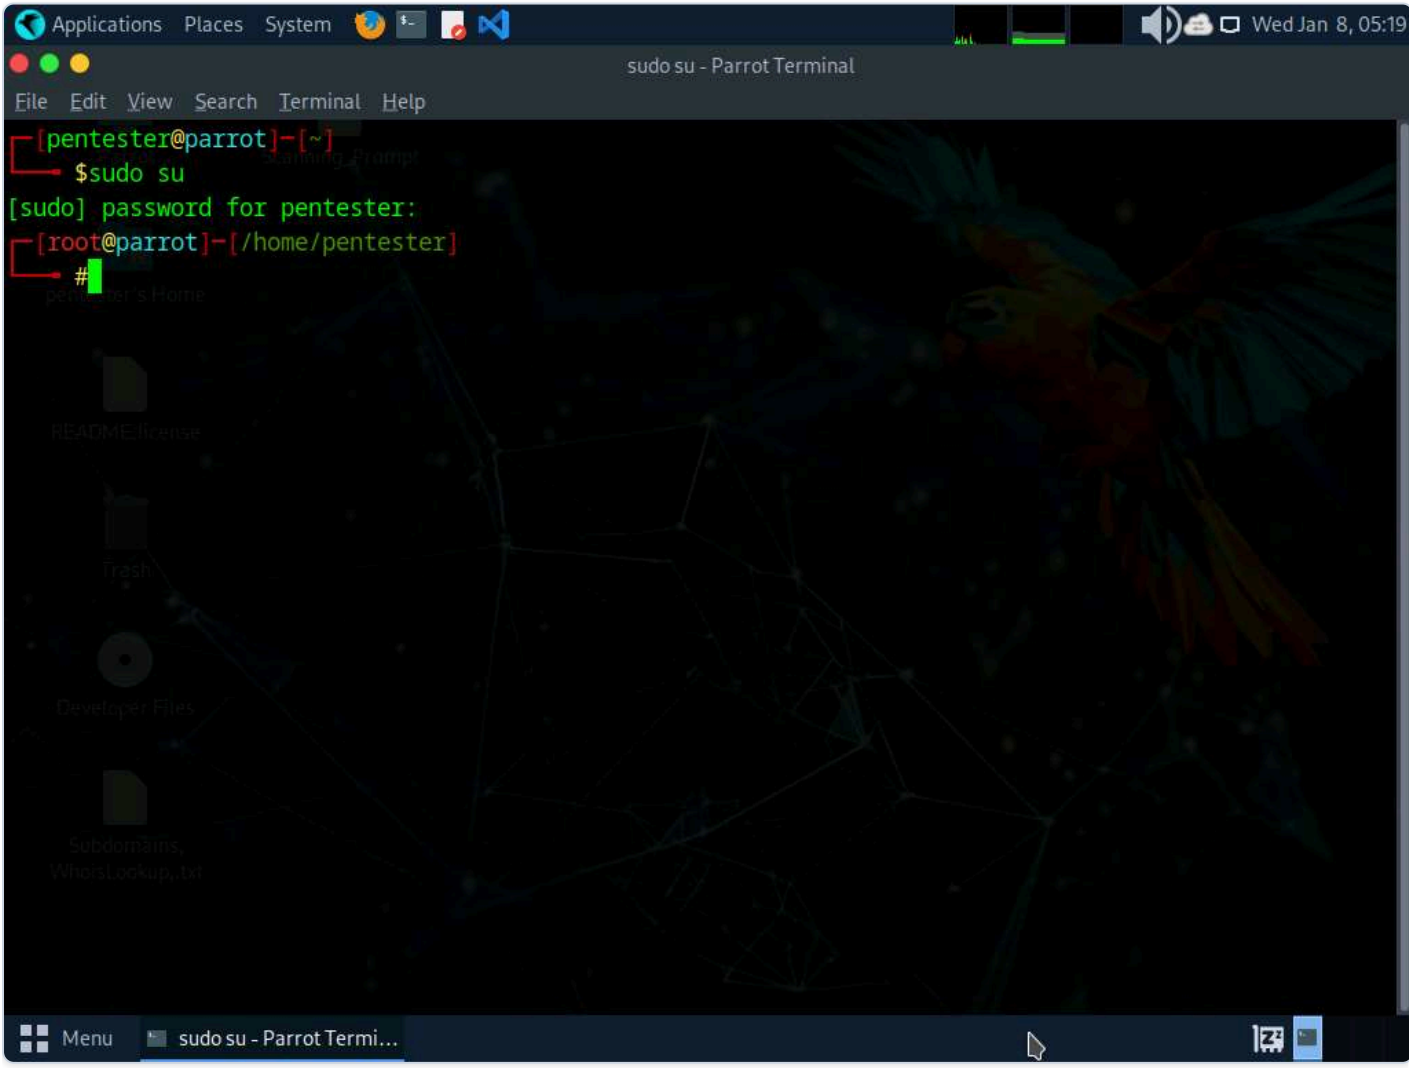

Task 2: Performing Social Media Content Analysis and OSINT Investigations using Maigret

Maigret is an open-source OSINT tool, to perform social media content analysis and investigate online profiles based on usernames. It checks for accounts on over 3,000 websites and collects publicly available information to build a comprehensive profile of the target.

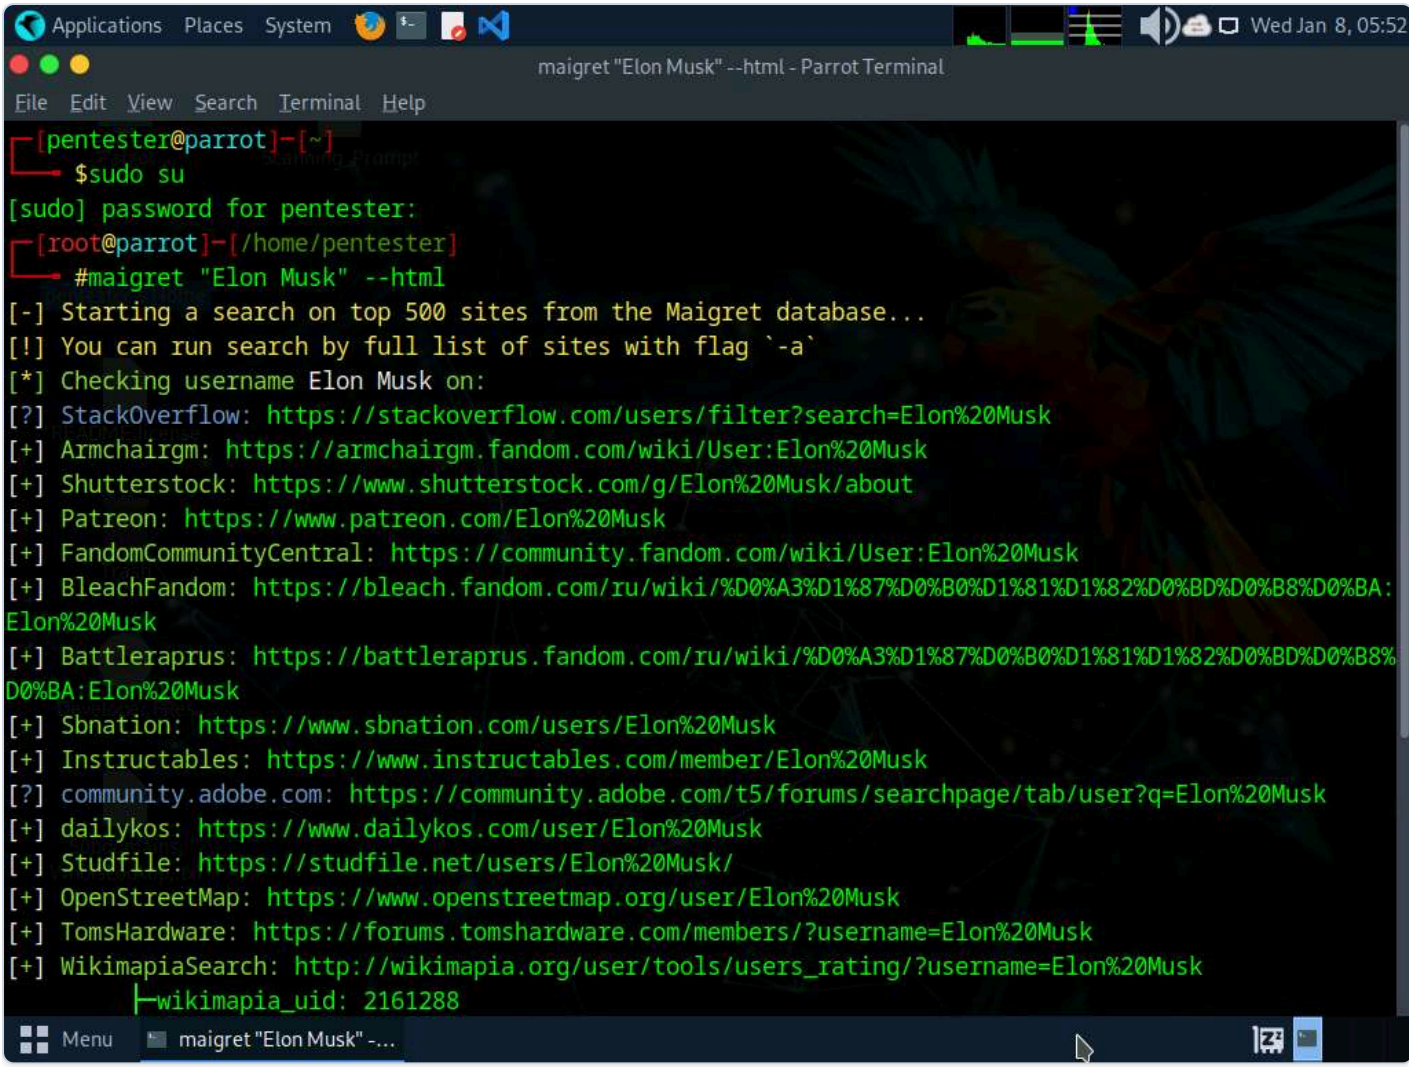

Here, we will use Maigret to perform Social Media content analysis.

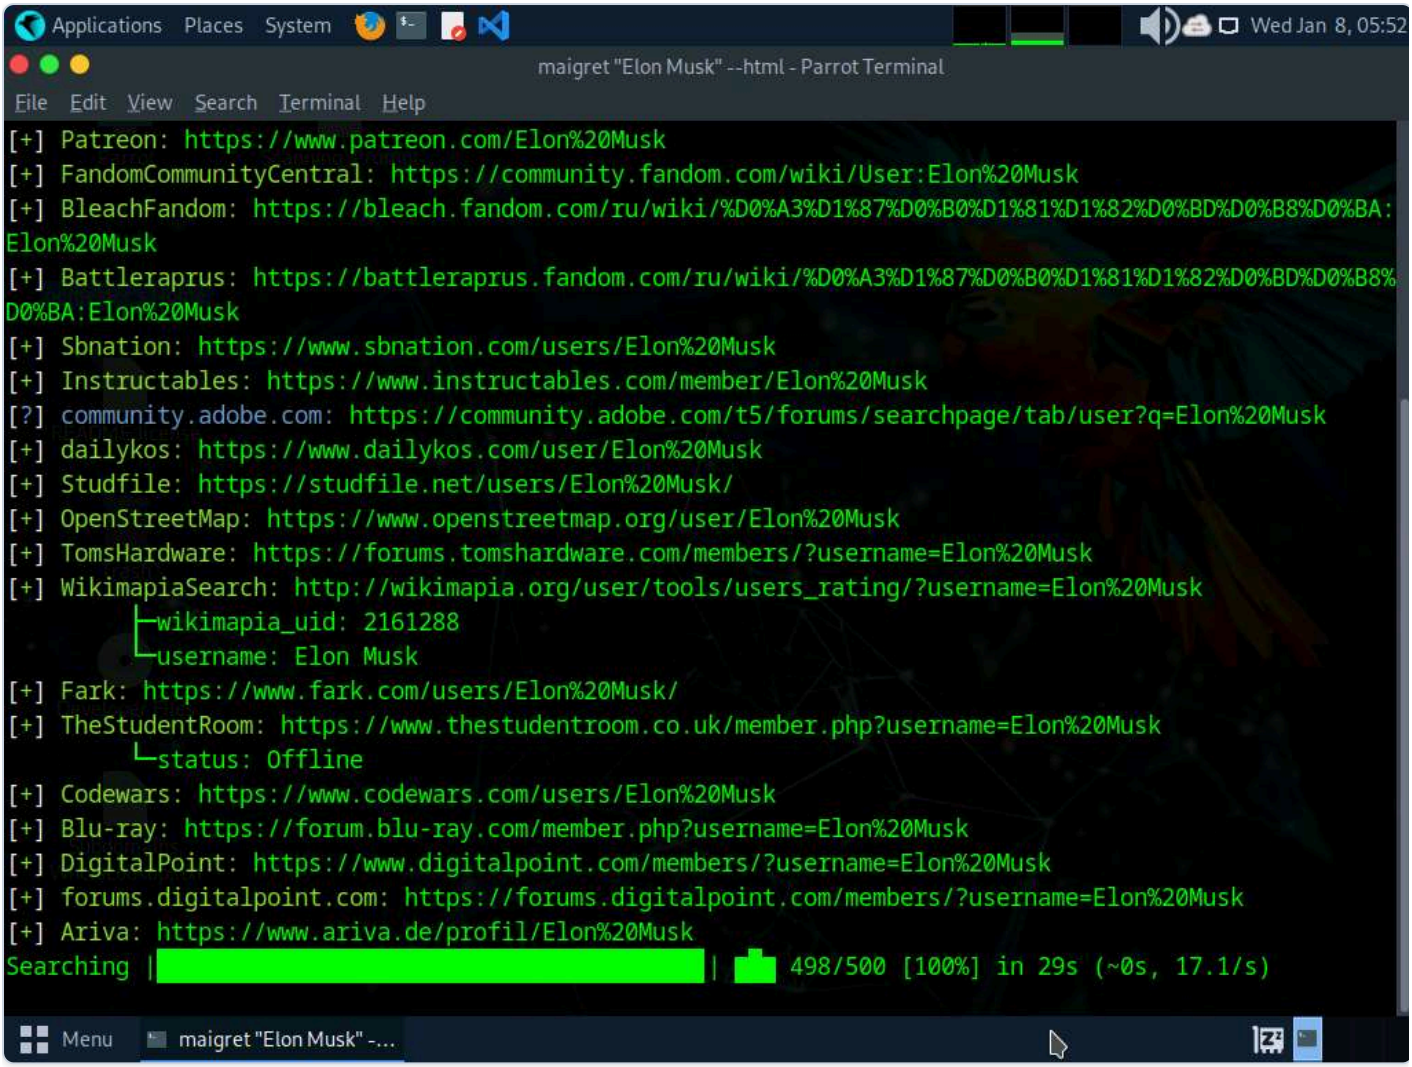

Lab Tasks

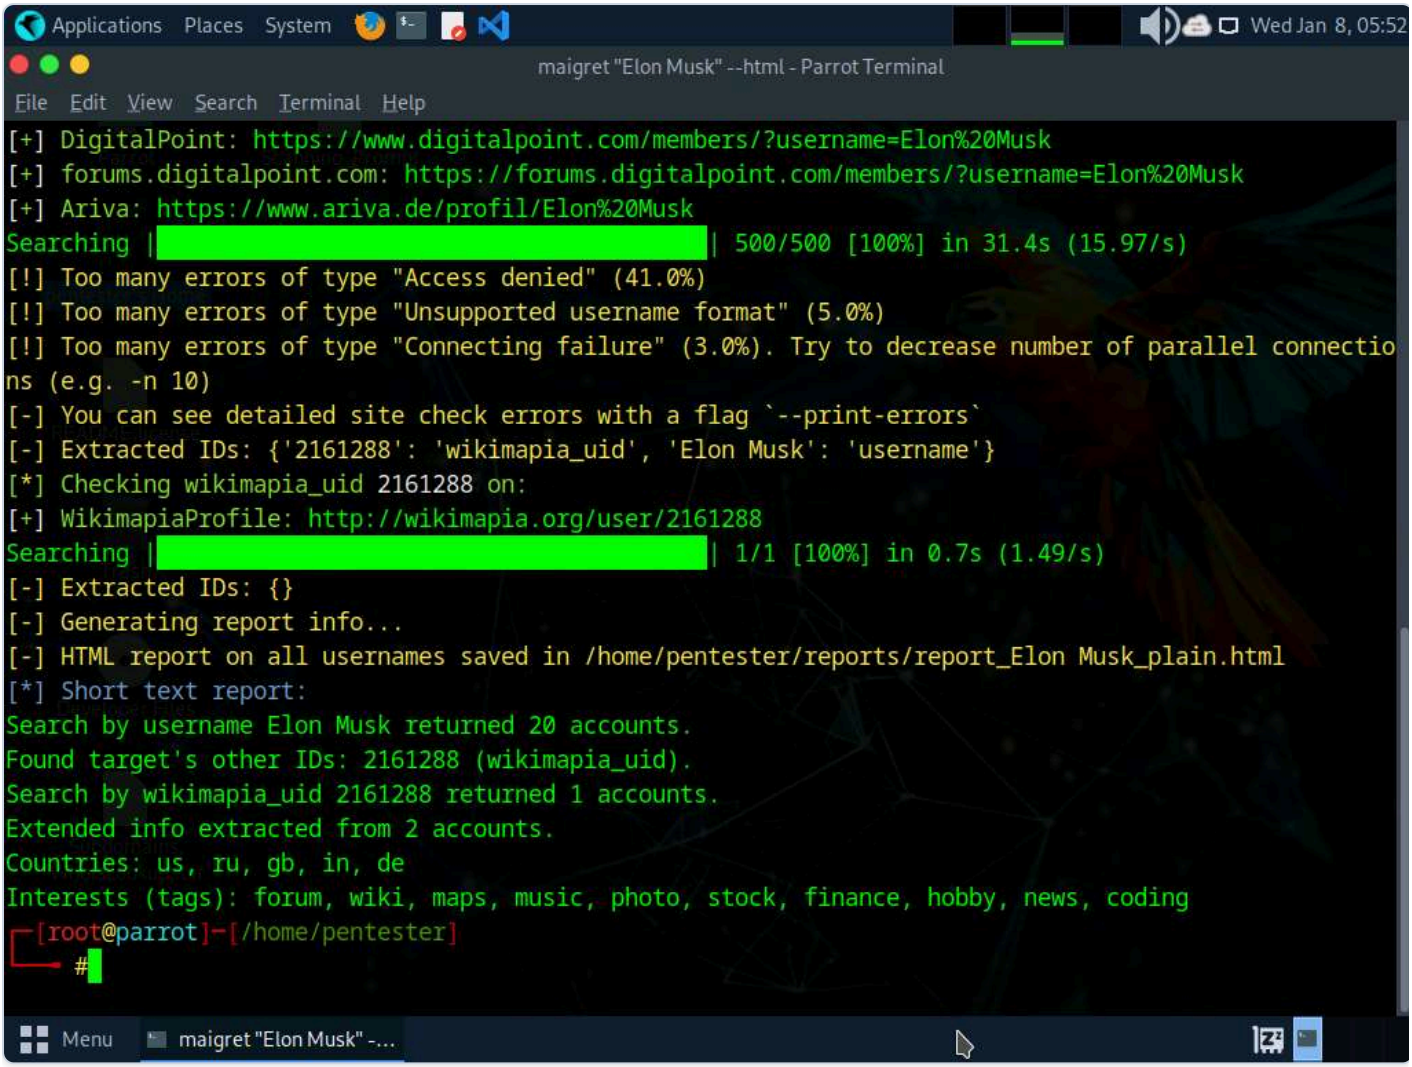

1. Click **Parrot Security** to switch to Parrot Security machine, open a Terminal window, and execute **sudo su** to run the programs as a root user (When prompted, enter the password **toor**). *(Skip this step if you are in the Parrot security machine)*

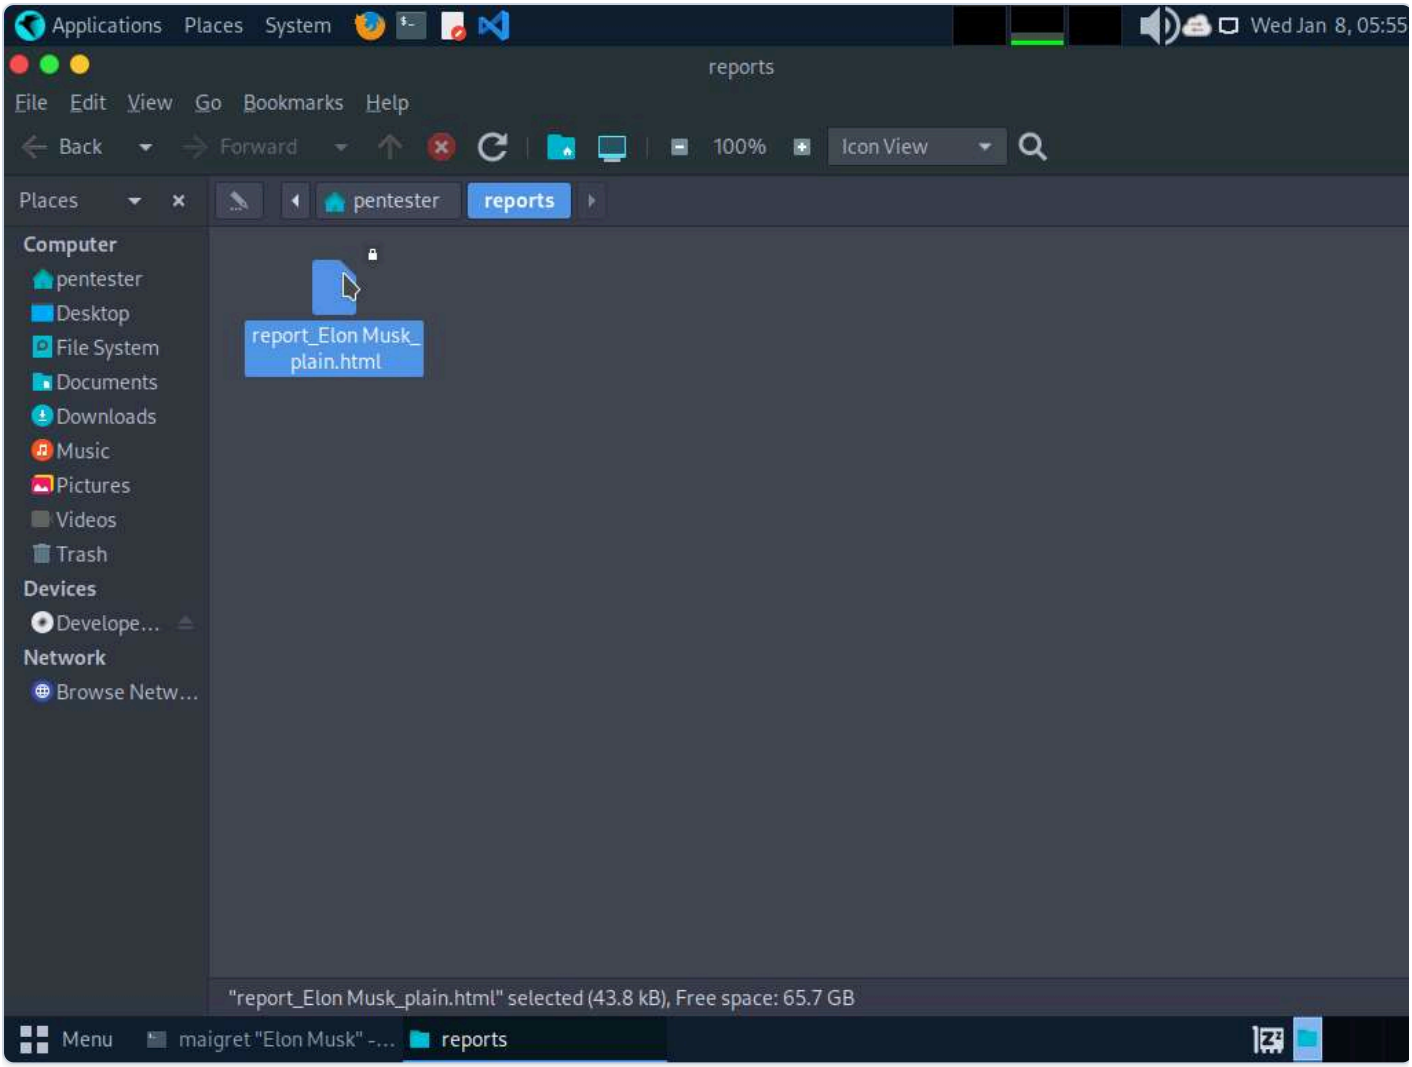

1. Run **maigret "Elon Musk" --html** command and you will get all the online profiles related to Elon Musk, as shown in the screenshot. Scroll down to view all the results.

maigret "Elon Musk" -...

1. After the analysis is completed, the report is generated in the HTML format and saved in the location **CPENTv2 Pen Testing Resources/Reports/report_Elon Musk_plain.html** as shown in the screenshot below.

1. Open the report in the browser.

Close all open windows.

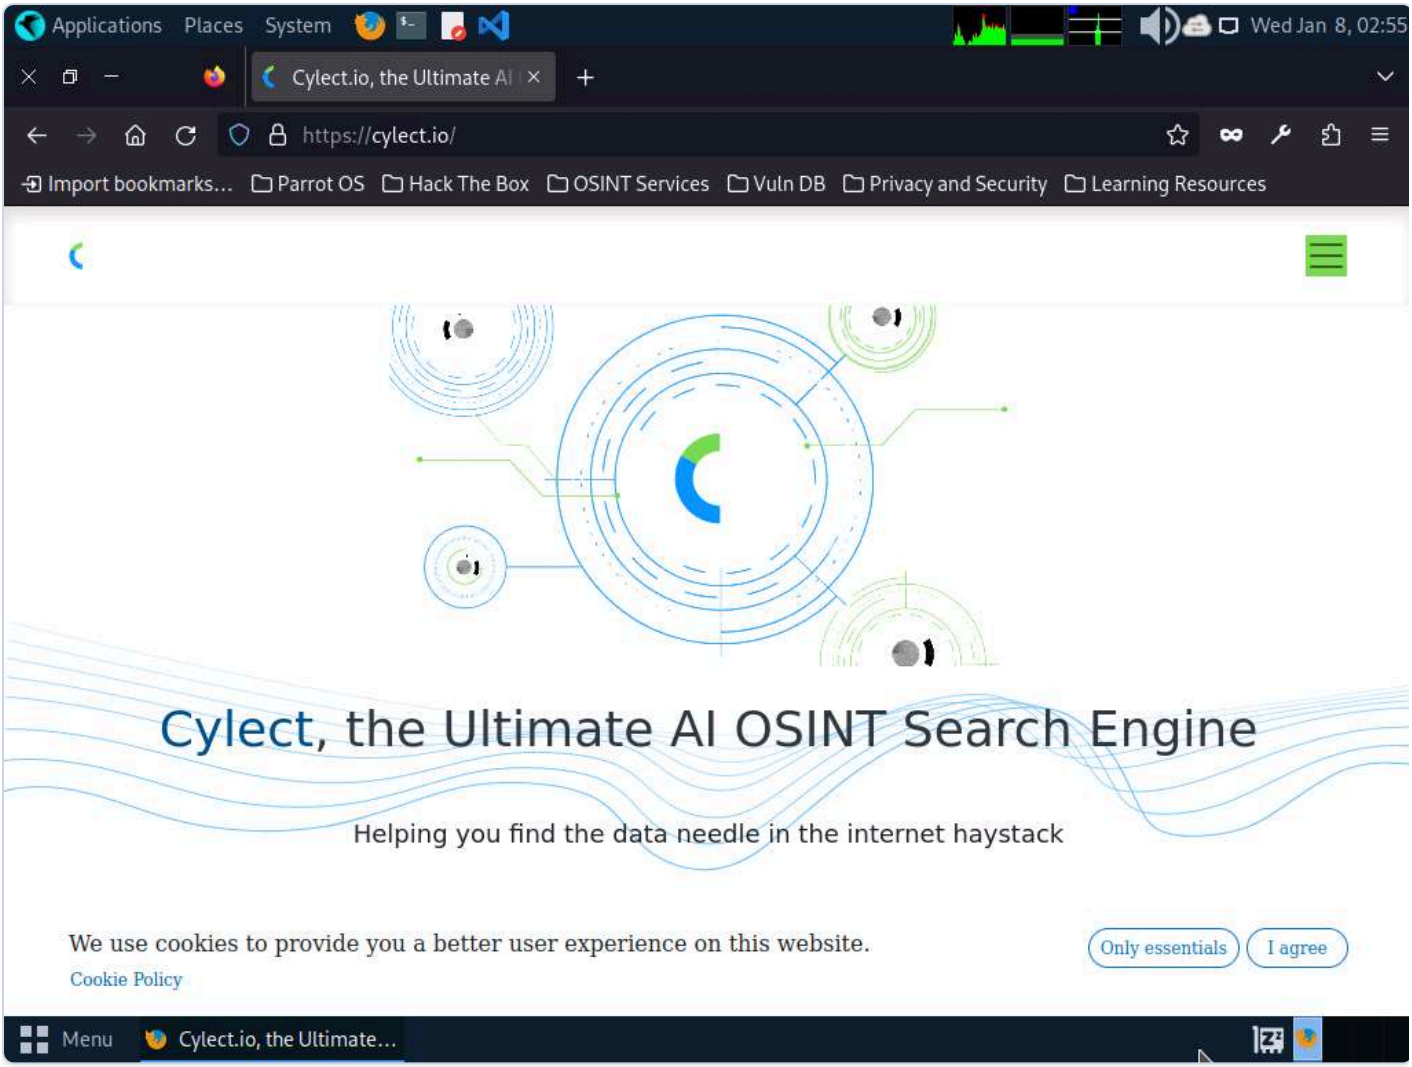

> **IMPORTANT:** ❓ **Question 3.3.2.1** On Parrot Security machine, utilize the Maigret tool to conduct social media content analysis and investigate online profiles associated with Satyam Nadella. Record the URL displayed under 'Studfile'. [!SUCCESS] ✅ **Answer:** **https://studfile.net/users/Satyam%20Nadella/**

Task 3: Searching for People Information using https://cylect.io/

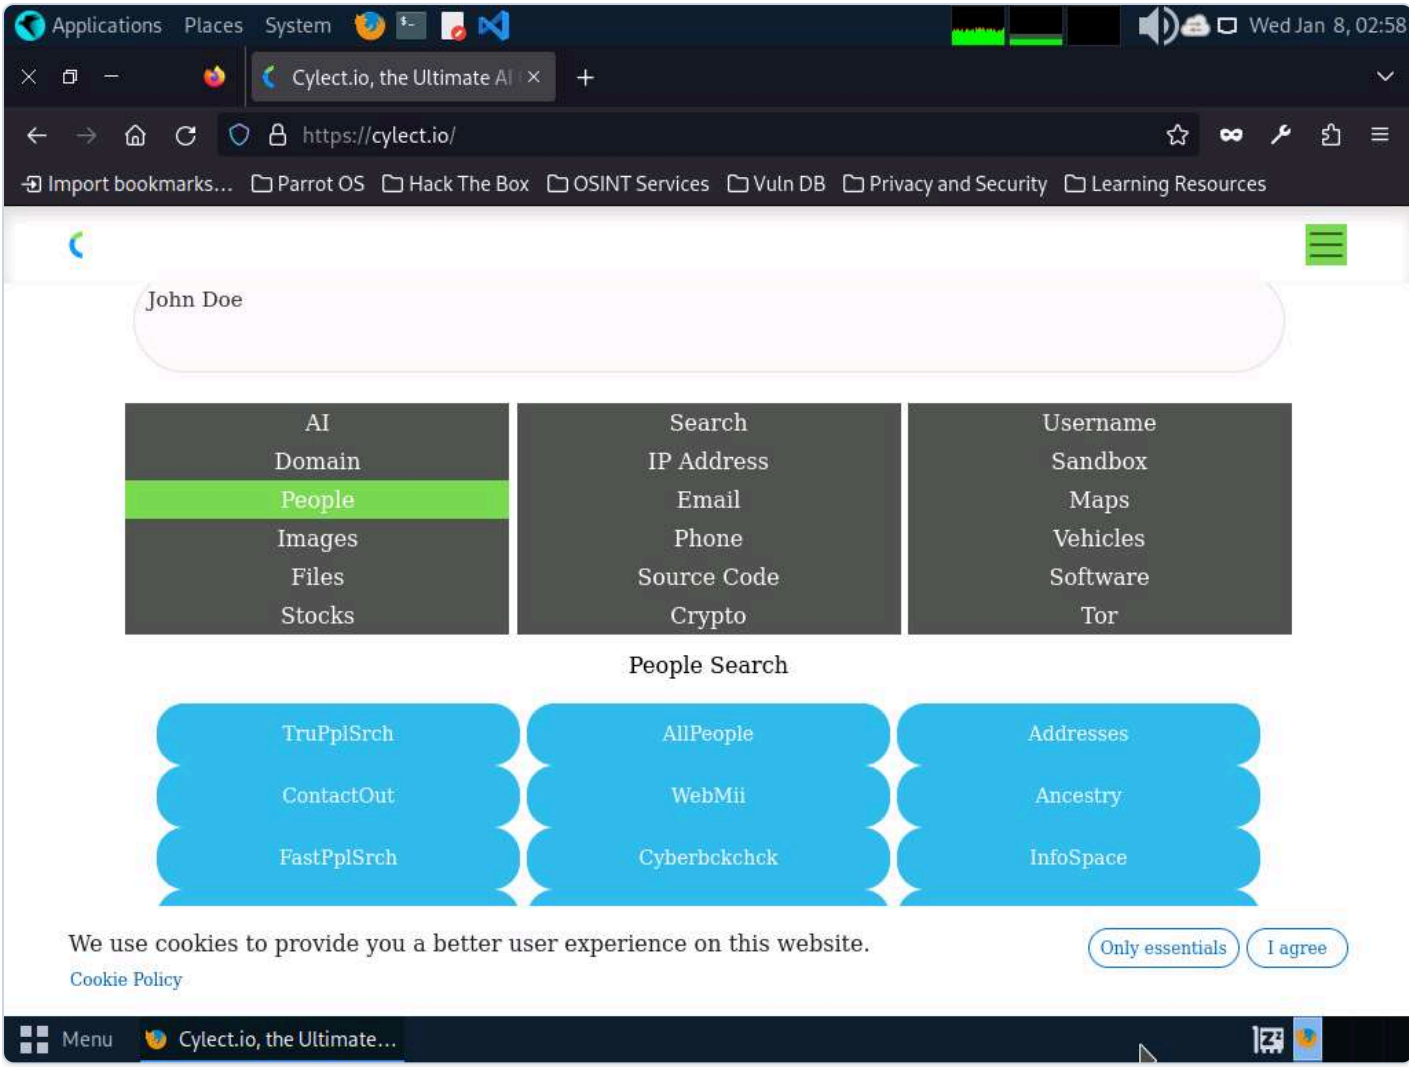

In this lab, you will use Cylect.io, an AI-powered OSINT tool, to search for and analyze publicly available information about individuals. By exploring tools like WebMii and Spokeo, you will learn to gather and review detailed personal data efficiently.

Lab Tasks

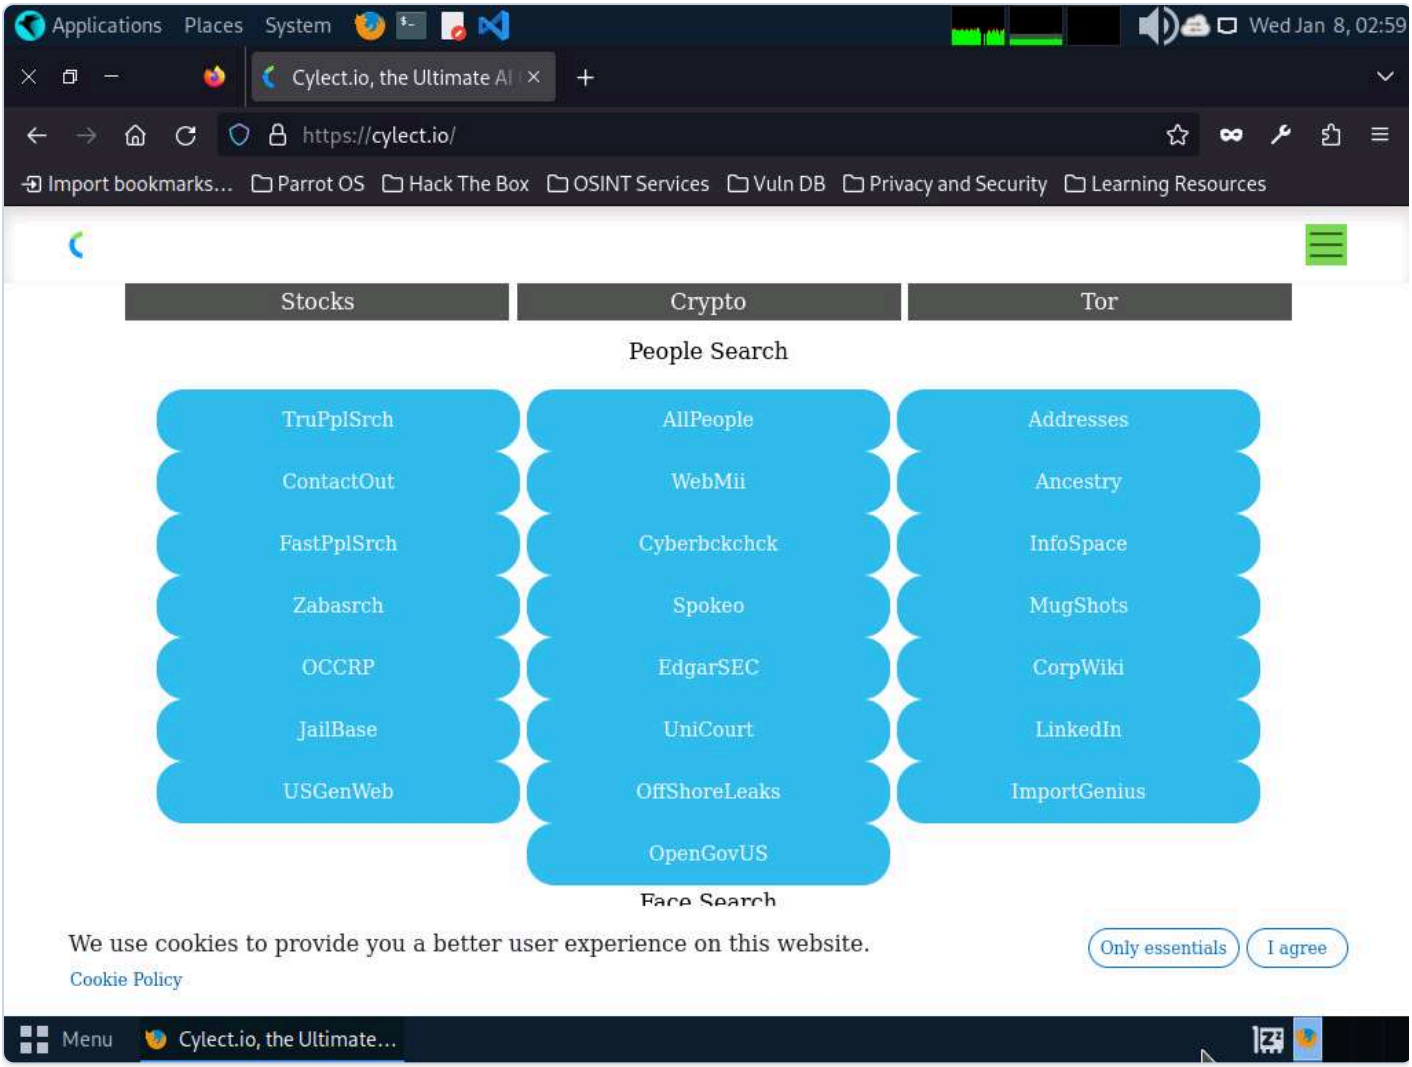

1. Click **Parrot Security** to switch to Parrot Security machine, open the browser, and visit the following URL:
2. **https://cylect.io/**

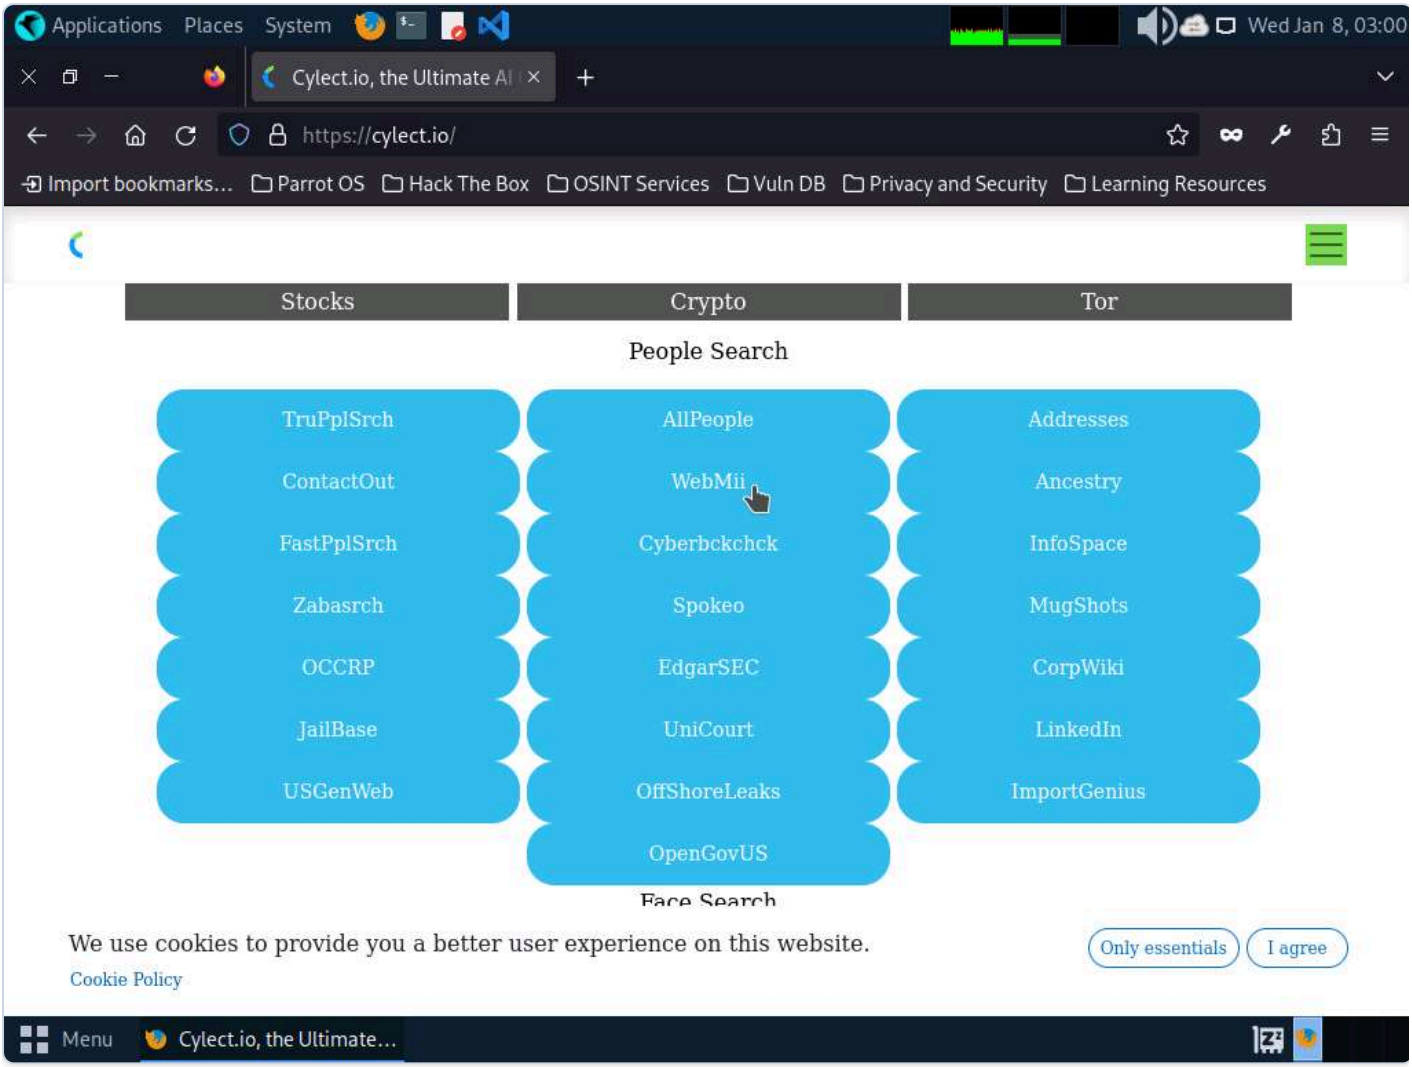

1. Scroll down and enter the target person's name in the search box. Then, select the **People** option from the list.

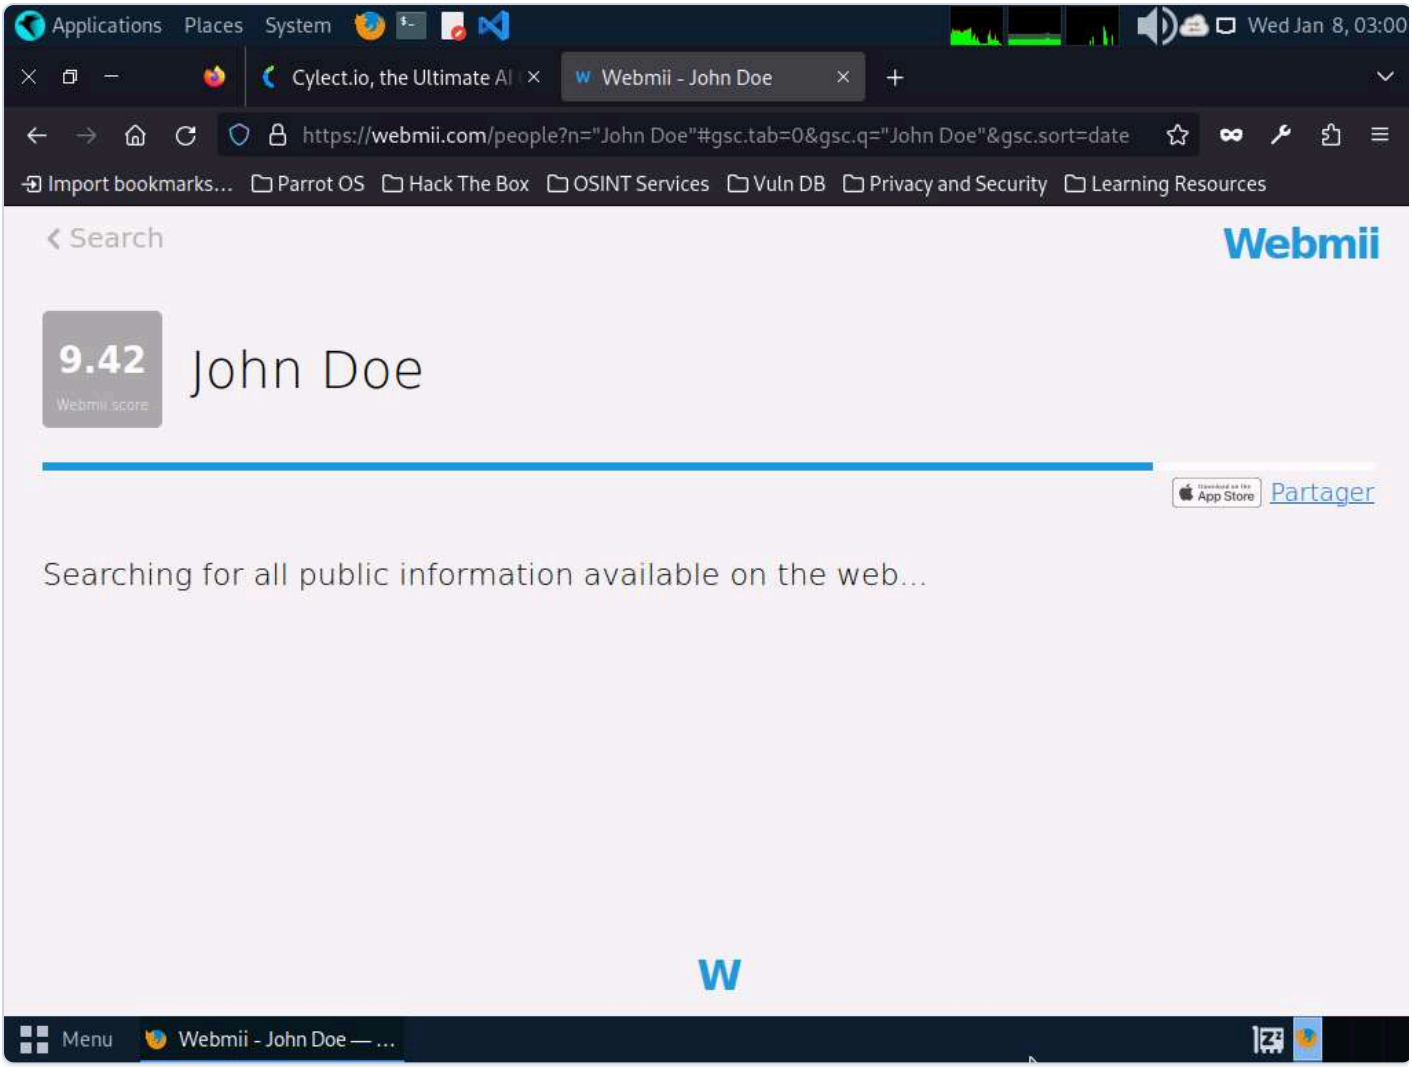

1. You will see a list of tools that provide information about people. From the list, select **WebMii**.
